

Github repositories

### **markdown-to-email**

Repository: <https://github.com/atherdon/markdown-to-email>

Here I tried to build a tool for quick email production. I like the results so far. We did about 40-60 emails via it. So it already has a great ROI. Even if we changed directions to SendGrid, it could be a valuable thing for later. Especially if you plan to play with different layouts and templates.

It's not finished for different reasons. I still want to complete it, because I think it can be helpful.

I can transfer this repo to the hackernoon GitHub organization and do a fork from it. And when I complete it, I can think about launching on PH as a promo for HN newsletters. What do you think?

### **newsletters**

Repository: <https://github.com/atherdon/newsletters>

Contained not finished emails and a simple website, built with a docusaurus framework. It's just markdown and some js. The preview you can see here: <https://docusaurus-newsletter.netlify.app/>

I will be happy if it gets launched.

### **Publish-pages**

Repository: <https://github.com/atherdon/publish-page>

copy on GitLab, in order to be able to do a quick preview: <https://gitlab.com/hackernoon/publish-on-hn>

I can just make it private and transfer ownership to David.

- <https://hackernoon.gitlab.io/publish-on-hn/index-nocode.html>
- <https://hackernoon.gitlab.io/publish-on-hn/index-privacy.html>

### **Creative repo**

We tried to combine creative assets with Kien, but we never finished it

Repository(private): <https://github.com/atherdon/creative>

Here is a shorter version, without any sensitive information: <https://gitlab.com/hackernoon/creative>

### **Static Pages for sales demo**

Demo - Utsav said that sometimes when he was showcasing our website to clients - some pages get broken. I did a static copy for some pages as a demo.

Repository: <https://gitlab.com/hackernoon/demo>

Preview:

- <https://hackernoon.gitlab.io/demo/index.html>
- <https://hackernoon.gitlab.io/demo/aws.html>
- <https://hackernoon.gitlab.io/demo/codeclimate.html>
- <https://hackernoon.gitlab.io/demo/tagged-stories.html>

### **Articles-telegram-bot**

- an attempt to create an advanced version of a bot that will subscribe you to some of our RSS feeds, similar to techbrief but on telegram. Not finished, but a good foundation on the shoulders of the framework that the Telegram team accepted.

Repository: <https://github.com/atherdon/articles-telegram-bot>

### **About-team**

An attempt to clone our about page to make it without a website builder. Must be quicker, responsive, and much easier to update and not pay recurring payments.

Repository: <https://github.com/atherdon/about-team>
